<p>報告書題目</p> <p>中国看護師調査</p> <p>< A P-E Interaction View of Overall Job Satisfaction ></p> <p>(職務満足の規定要因：P－E相互作用の視点から)</p>			
<p>報告書概要</p> <p>Chapter 6 includes a brief historical review of nurse’s condition in China and a background description of Chinese nurses' job satisfaction. Complementary to the personality-specific determinants and environmental-specific factors' separated analysis followed in previous chapters, an Interactionist approach is introduced to jointly investigate the effect of environmental and personality variables on job satisfaction. This chapter also includes some policy implications and recommendations to improve nurses situation in China based on team results.</p> <p>A person-situation perspective was used to test different models including P-E interactional determinants. One possible explanation why the results obtained from testing the interaction terms are not as expected is the selection of variable included in the interactions. Locus of control represents only one aspect of nurses' personality but it is not a measurement of the BIG5 personality traits, which would have been the ideal variable to be tested.</p>
